

# RSA VPN Two-Factor Authentication

Secure, remote access for high security needs.

Do you really know who's accessing your most sensitive networked information assets? If you're using security built on static, reusable passwords, you could be a sitting duck for hackers. For businesses with PCI or HIPAA compliance requirements or that need secure remote administration or end-user access, two-factor authentication is a key piece of maintaining compliance and system security. Rackspace Two-Factor Authentication provides better assurance that authorized users are positively identified before they interact with mission-critical data and applications, whether through client-based VPN or web-based SSL VPN.

## How It Works

Each RSA Authenticator token automatically generates a unique password every 60 seconds. Two-factor authentication requires users to enter something they know (a unique PIN) and something they have (the authenticator token password) — providing a much more reliable level of user authentication than solely relying on reusable passwords.

## Rackspace® Two-Factor Identification Options

Choose between the RSA SecurID® Appliance 130 or the 250:

- RSA SecurID Appliance 130 for simple, cost-effective deployments in companies of any size, including single-replica, high-availability (HA) deployments.
- RSA SecurID Appliance 250 with dual power and redundant discs for organizations that require large, HA deployments (up to 15 replicas).

Once you've chosen your SecurID Appliance, you can purchase RSA Authenticator tokens in 10, 25, 50, 100, 150, or 250 token bundles. Additional user licenses and tokens can be added to the appliances for an additional cost at any time.

## Rackspace and RSA

Two-factor Authentication from Rackspace is powered by industry-leading RSA SecurID technology, with a 20-year history of outstanding performance and innovation.

A team of Rackspace CCSP- and RSA-certified professionals fully manage your dedicated RSA SecurID appliance and Authenticator tokens.
